

Proposed Solution

The proposed solution is an Automated Network Request Management System in ServiceNow designed to simplify and automate the complete lifecycle of network-related service requests.

The system provides a self-service Service Catalog where users can submit network requests using structured forms. After submission, the request is processed through an automated Flow Designer workflow that captures the required variables, creates the network record, initiates approvals, applies approval-based logic, sends notifications, and updates the request record.

Key Components

- Service Catalog: Provides the Network Request catalog item for users.
- Catalog Variables: Capture details such as connection type, device type, address, and device information.
- Catalog UI Policies: Dynamically display fields based on user selections.
- Flow Designer: Automates the request-processing workflow.
- Approval Workflow: Routes requests for approval or rejection.
- Network Database: Stores the generated network request records.
- Notifications: Keeps users and relevant teams informed about request progress.
- Reporting & Analytics: Enables monitoring of request volume, resolution time, and SLA adherence.

Proposed Solution Flow

User submits request → Request details captured → Request record created → Approval → Approved/Rejected decision → Network fulfillment → Notification → Record update & closure

The solution aims to provide faster processing, reduced manual effort, improved transparency, and better control over network-service requests.

Date	15 -8- 2026
Project Name	Automated-Network-Request Management
Maximum Marks	2 Marks

Section	Description
1. Problem Statement	Manual network request processing causes delays, approval bottlenecks, repetitive work, and limited request visibility.
2. Idea / Solution	A ServiceNow-based system that automates network request submission, approvals, record creation, notifications, and fulfillment.
3. Novelty / Uniqueness	Combines Service Catalog, dynamic forms, automated approvals, Flow Designer, notifications, and request tracking in one workflow.
4. Social Impact / Customer Satisfaction	Provides faster processing, easier request submission, better transparency, timely updates, and reduced IT workload.

Section	Description
5. Business Model	Enterprise ServiceNow implementation and automation solution; value is primarily generated through reduced processing time and operational costs.
6. Scalability	Can be extended with additional catalog items, workflows, reports, network automation integrations, and other IT service requests.
