

Ideation Phase

Brainstorm & Idea Prioritization Template

Date	15 August 2026
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization Template:

Brainstorming provides a free and open environment that encourages everyone during the ideation process to participate in the creative thinking process that leads to problem solving. For the Automated Network Request Management project, the project work explores multiple ways to reduce manual effort, improve request routing, automate approvals and assignments, and provide faster fulfillment of network-related service requests. Ideas are generated first and then grouped and prioritized based on their importance and feasibility.

Project Problem Statement: Network-related service requests are often handled through manual communication, manual routing, repeated approvals, and task assignment. This can cause delays, missed SLAs, inconsistent processing, and unnecessary effort. The project aims to automate the request lifecycle using ServiceNow Service Catalog, workflows/flows, approvals, task assignment, notifications, and, where possible, network automation integration.

Step-1: Problem Identification and Problem Statement Selection

Automated Network Request Management in ServiceNow

Activity	Discussion / Outcome	Selected Direction
Project Problem Review	Review common issues in network request handling.	Focus on manual processing delays.
Problem Identification	Requests require manual routing, approvals, assignment and follow-up.	Automate the request lifecycle.
Problem Statement	Users need a simple way to submit network requests and track progress.	Use ServiceNow Service Catalog and automated flows.
Goal	Improve speed, consistency, SLA compliance and user experience.	Build an end-to-end automated request process.

Step-2: Brainstorm, Idea Listing and Grouping

Project Brainstorming - Idea Listing & Grouping

The project work brainstormed possible solutions without initially judging the ideas. The ideas were then grouped into functional areas that support the Automated Network Request Management solution.

Request Submission

- Create a ServiceNow Service Catalog item for network requests.
- Use structured variables for request type, source/destination, priority and business justification.
- Provide a self-service portal for easy submission.

Automated Routing

- Route requests automatically to the correct network support group.
- Use request category and selected service to determine assignment.
- Reduce manual triage by using Flow Designer logic.

Approvals

- Trigger approvals based on request type and risk.
- Send approval tasks to the appropriate approver.
- Continue fulfillment automatically after approval.

Task Assignment

- Automatically create fulfillment tasks for network project works.
- Assign tasks based on group and request conditions.
- Track task status from the RITM/request record.

Notifications & SLA

- Notify users when requests are submitted, approved, rejected or completed.
- Use SLA tracking to identify approaching deadlines.
- Improve transparency through status updates.

Network Automation / Integration

- Integrate with network automation tools where feasible.

- Execute approved standard changes automatically.
- Return execution status to ServiceNow.

Idea Grouping Summary

Group	Main Purpose	Expected Benefit
Catalog & Portal	Easy request submission	Better user experience
Routing & Assignment	Automated work distribution	Less manual triage
Approvals	Controlled authorization	Improved governance
Tasks & SLA	Track fulfillment	Faster and consistent processing
Notifications	Keep users informed	Better transparency
Integration	Automated execution	Reduced human intervention

Step-3: Idea Prioritization

Ideas are prioritized by considering two factors: Importance to the project and Feasibility of implementation. High-importance and high-feasibility ideas are selected first for the core solution.

Idea	Importance (1–5)	Feasibility (1–5)	Priority	Reason
Service Catalog Request	5	5	High	Core entry point for standardized network requests.
Automated Routing	5	5	High	Directly reduces manual triage and delays.
Approval Automation	5	4	High	Provides control while reducing approval effort.
Automatic Task Assignment	5	5	High	Ensures work reaches the correct network project work.
Notifications & SLA Tracking	4	5	High	Improves transparency and SLA compliance.
Network Tool Integration	4	3	Medium	Strong future value but depends on available integration.
Dashboard / Analytics	3	4	Medium	Useful for monitoring and reporting after core automation.

Final Prioritized Solution

- 1. Service Catalog + Self-Service Portal
- 2. Automated Routing and Group Assignment
- 3. Conditional Approval Workflow
- 4. Automatic Fulfillment Task Creation and Assignment
- 5. Notifications and SLA Tracking
- 6. Optional Network Automation Tool Integration

Expected Outcome: A streamlined ServiceNow solution that allows users to submit network requests through self-service, automatically routes and approves requests, creates fulfillment tasks, keeps users informed, tracks SLAs, and supports automated execution where integration is available.
